If you're reading a paper or HTML copy, you should get your copy in PDF or OpenOffice.org format on <http://free-electrons.com/articles/elfs!>

Tutorial goals

Build a tiny embedded system entirely from scratch, in 40 minutes

- ▶ Linux kernel configuring and compiling
- ▶ Root filesystem creation
- ▶ Busybox compiling and installation
- ▶ Device file creation
- ▶ System initialization scripts: virtual filesystems, networking
- ▶ Setup of a simple HTTP interface to the system

Show you how simple this can be!

Top-down approach

Top-down approach to building an embedded system

- ▶ Starting from a complete desktop GNU/Linux distribution (Debian, Fedora...) and removing unneeded stuff.
- ▶ Very tedious job: need to go through a huge number of files and packages. Need to understand what each file and package is about before removing it.
- ▶ Keeping unnecessarily complex scripts and configuration files.
- ▶ The end result is still quite big, as standard desktop toolsets and libraries are used. Lots of shared libraries still needed too.

Bottom-up approach

Bottom-up approach to building embedded systems

- ▶ Starting with an empty or minimalistic root filesystem, adding only things that you need.
- ▶ Much easier to do! You just spend time on things you need.
- ▶ Much easier to control and maintain: you build an understanding about the tools you use.
- ▶ You only need very simple configuration scripts.
- ▶ The end result can be extremely small, all the more as you use lightweight toolsets instead.

Embedded Linux From Scratch

Tools used in this tutorial
Explanatory slides to show while compiling

qemu

<http://bellard.org/qemu/>

Fast processor emulator
using a portable dynamic translator.

The logo for QEMU, consisting of the letters 'QEMU' in a stylized, green, 3D font with a slight shadow effect.

2 operating modes

- ▶ Full system emulation: processor and various peripherals
Supported: `x86`, `x86_64`, `ppc`, `arm`, `sparc`, `mips`, `m68k`
- ▶ User mode emulation (**Linux** host only): can run applications compiled for another CPU.
Supported: `x86`, `ppc`, `arm`, `sparc`, `mips`, `m68k`

qemu examples

User emulation

- ▶ Easy to run BusyBox for arm on i386 GNU / Linux:
`qemu-arm -L /usr/local/arm/3.3.2 \`
`/home/bart/arm/busybox-1.00-pre8/busybox ls`
- ▶ `-L`: target C library binaries path (here cross-compiler toolchain path)

System emulation

- ▶ Even easier to run:
`qemu linux.img`
- ▶ `linux.img`: full partition image including the kernel
Plenty of images for free operating systems on <http://free.oszoo.org>!

General purpose toolbox: busybox

<http://www.busybox.net/> from Codepoet Consulting

- ▶ Most Unix command line utilities within a single executable!
Even includes a web server!
- ▶ Sizes less than 1 MB (statically compiled with **glibc**)
less than 500 KB (statically compiled with **uClibc**)
- ▶ Easy to configure which features to include
- ▶ The best choice for
 - ▶ Initrds with complex scripts
 - ▶ Any embedded system!

Busybox commands!

addgroup, adduser, adjtimex, ar, arping, ash, awk, basename, bunzip2, bzcat, cal, cat, chgrp, chmod, chown, chroot, chvt, clear, cmp, cp, cpio, crond, crontab, cut, date, dc, dd, dealloctv, delgroup, deluser, devfsd, df, dirname, dmesg, dos2unix, **dpkg**, dpkg-deb, du, dumpkmap, dumpleases, echo, egrep, env, expr, false, fbset, fdflush, fdformat, fdisk, fgrep, find, fold, free, freeramdisk, fsck.minix, ftpget, ftpput, getopt, getty, grep, gunzip, gzip, halt, hdparm, head, hexdump, hostid, hostname, **httpd**, hush, hwclock, id, ifconfig, ifdown, ifup, inetd, init, insmod, install, ip, ipaddr, ipcalc, iplink, iproute, iptunnel, kill, killall, **klogd**, lash, last, length, linuxrc, ln, loadfont, loadkmap, logger, login, logname, logread, losetup, ls, lsmod, makedevs, md5sum, msg, mkdir, mkfifo, mkfs.minix, mknod, mkswap, mktemp, modprobe, more, mount, msh, mt, mv, nameif, nc, netstat, nslookup, od, openvt, passwd, patch, pidof, ping, ping6, pipe_progress, pivot_root, poweroff, printf, ps, pwd, rdate, readlink, realpath, reboot, renice, reset, rm, rmdir, rmdir, route, **rpm**, rpm2cpio, run-parts, rx, sed, seq, setkeycodes, shasum, sleep, sort, start-stop-daemon, strings, stty, su, sulogin, swapoff, swapon, sync, sysctl, syslogd, tail, tar, tee, telnet, **telnetd**, test, tftp, time, top, touch, tr, traceroute, true, tty, **udhcpd**, **udhcpd**, umount, uname, uncompress, uniq, unix2dos, unzip, uptime, usleep, uudecode, uuencode, vconfig, **vi**, vlock, watch, watchdog, wc, **wget**, which, who, whoami, xargs, yes, zcat

Sep 15, 2009

glibc

<http://www.gnu.org/software/libc/>

- ▶ C library from the GNU project
- ▶ Designed for performance, standards compliance and portability
- ▶ Found on all GNU / Linux host systems
- ▶ Quite big for small embedded systems: about ~1.7MB on arm (Familiar Linux iPAQs - `libc`: 1.2 MB, `libm`: 500 KB)
- ▶ Example “hello world” program size: 12 KB (dynamically linked), 350 KB (statically linked).

uClibc

<http://www.uclibc.org/> from CodePoet Consulting

- ▶ Lightweight C library for small embedded systems, with most features though.
- ▶ The whole **Debian Woody** was recently ported to it... You can assume it satisfied most needs!
- ▶ Example size (**arm**): approx. 400KB
(**libuClibc**: 300 KB, **libm**: 55KB)
- ▶ Example “hello world” program size: 2 KB (dynamically linked), 18 KB (statically linked).

Kernel userspace interface

A few examples:

- ▶ `/proc/cpuinfo`: processor information
- ▶ `/proc/meminfo`: memory status
- ▶ `/proc/version`: version and build information
- ▶ `/proc/cmdline`: kernel command line
- ▶ `/proc/<pid>/environ`: calling environment
- ▶ `/proc/<pid>/cmdline`: process command line

... and many more! Complete details in the kernel sources:
`Documentation/filesystems/proc.txt`

Embedded Linux From Scratch

What we did

Compiling the Linux kernel

- ▶ Getting the Linux sources from <http://kernel.org>
- ▶ Start with a minimalistic kernel configuration:
`make allnoconfig`
- ▶ Adding settings specific to the embedded system:
`make xconfig` or `make menuconfig`
(the kernel configuration file that we use can be found on http://free-electrons.com/doc/embedded_lfs/linux-2.6.25.4.config)
- ▶ Compiling:
`make`
- ▶ Result: compressed kernel image `arch/x86/boot/bzImage`

Creating a root filesystem

- ▶ Creating an empty file with a 400K size:

```
dd if=/dev/zero of=rootfs.img bs=1k count=400
```

- ▶ Formatting this file for the `ext2` filesystem:

```
mkfs.ext2 -i 1024 -F rootfs.img
```

1 inode every 1024 bytes -> 400 files

instead of 1 inode every 8192 bytes -> only 56 files!

Compiling busybox

- ▶ Getting the sources from <http://busybox.net>
- ▶ Configuring BusyBox:
`make xconfig`
Choosing to build a statically, natively compiled executable.
We used BusyBox 1.10.2 with the following configuration:
http://free-electrons.com/doc/embedded_lfs/busybox-1.10.2.config
- ▶ Compiling busybox:
`make`
- ▶ Pre-installing busybox (in the `_install/` subdirectory):
`make install`
- ▶ Result: a **500K** executable implementing all the commands that we need!

Re-compiling busybox

500K was already way too big for a perfect embedded system!

- ▶ Configuring busybox again
`make menuconfig`

Choosing to build a statically, “cross-compiled” executable, using a `uClibc` toolchain instead of the standard `glibc` one.

- ▶ Compiling busybox:
`make`

- ▶ Pre-installing busybox (in the `_install/` subdirectory):
`make install`

- ▶ Result: a **250K** executable implementing all the commands that we need!

Populating the root filesystem

Logged as `root`:

- ▶ Creating a mount point:

```
mkdir /mnt/rootfs
```

- ▶ Mounting the root filesystem image:

```
mount -o loop rootfs.img /mnt/rootfs
```

- ▶ Copying the busybox file structure into the mounted image:

```
rsync -a busybox/_install/ /mnt/rootfs/  
chown -R root:root /mnt/rootfs/
```

- ▶ Flushing the changes into the mounted filesystem image:

```
sync
```

Booting the virtual system

Using the `qemu` emulator as a bootloader
(no need to copy the kernel to the target storage)

```
qemu \  
-m 32 \  
-hda rootfs.img \  
-kernel linux-2.6.25.4/arch/x86/boot/bzImage \  
-append "root=/dev/hda" \  
Kernel image \  
Kernel command line
```

Creating device files

- ▶ Creating device files when programs complain:

```
mkdir /mnt/rootfs/dev
```

```
mknod /mnt/rootfs/dev/console c 5 1
```

```
mknod /mnt/rootfs/dev/null c 1 3
```

- ▶ Taking the GNU/Linux host as an example to find correct major and minor numbers:

```
ls -l /dev/console
```

```
ls -l /dev/null
```

Mounting virtual filesystems

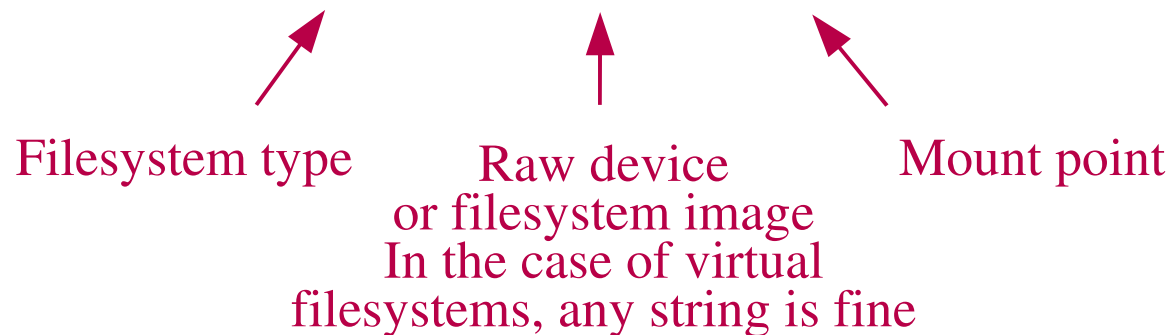

Making `/proc` and `/sys` available
(required by several command line tools such as `ps`)

▶ Mounting `/proc`:

```
mount -t proc none /proc
```

▶ Mounting `/sys`:

```
mount -t sysfs none /sys
```

/etc/inittab file for busybox init

Creating the `/etc/inittab` file required by busybox `init`
Getting an example from busybox documentation
(not from the GNU/Linux host... missing features!)

```
# This is run first script
::sysinit:/etc/init.d/rcS
# Start an "askfirst" shell on the console
::askfirst:-/bin/sh
# Stuff to do when restarting the init process
::restart:/sbin/init
# Stuff to do before rebooting
::ctrlaltdel:/sbin/reboot
::shutdown:/bin/umount -a -r
```

Setting up networking

▶ Adding TCP/IP and network card driver to the kernel

▶ Bringing up the network interface:

```
ifconfig eth0 172.20.0.2
```

▶ Using the GNU/Linux host as a gateway:

```
route add default gw 172.20.0.1
```

▶ Testing networking:

```
ping -c 3 172.20.0.1
```

`-c 3`: useful when `[Ctrl][C]` doesn't work
(missing tty settings)

▶ Testing routing:

```
ping -c 3 <external address>
```

Starting up a http server

- ▶ Copying HTML pages on `/www` (for example)
- ▶ Creating CGI scripts in `/www/cgi-bin/`
- ▶ Starting the busybox http server:
`/usr/sbin/httpd -h /www/ &`

/etc/init.d/rcS startup script

```
#!/bin/sh
mount -t proc none /proc
mount -t sysfs none /sys
ifconfig eth0 172.20.0.2
route add default gw 172.20.0.1
/usr/sbin/httpd -h /www/ &
/bin/sh
```

See how simple this can be!

/etc/init.d/rcS common mistakes

- ▶ Do not forget `#!/bin/sh` at the beginning of shell scripts! Without the leading `#!` characters, the Linux kernel has no way to know it is a shell script and will try to execute it as a binary file!
- ▶ In our example, do not forget to start a shell at the end of the script. Otherwise, execution will just stop without letting you type new commands!

A simplistic CGI script

```
/www/cgi-bin/uptime:  
  
#!/bin/sh  
echo "Content-type: text/html"  
echo ""  
echo "<html><header></header><body>"  
echo "<h1>Uptime information</h1>"  
echo "Your embedded device has been  
running for:<pre><font color=Blue>"  
echo `uptime`  
echo "</font></pre></u>"  
echo "</body></html>"
```

Limitations

A few minor limitations

- ▶ CGI scripts: can't implement non-trivial scripts
Need to code in C to support posting and URL parsing.
- ▶ System specific software: can't be part of busybox.
Need more C executables. As a consequence, need to include the **uClibc** library and compile the executables with shared library support.

They are easy and cheap to overcome!

Real embedded systems

This tutorial has already been done on real development boards!

- ▶ Need to install and configure a bootloader (if missing)
- ▶ Need to transfer kernel and root filesystem images to the target.
An efficient way is to make the target boot on a NFS exported directory on the GNU/Linux host.

Thanks

- ▶ To people who sent corrections or suggestions:
Florent Peyraud, Fabrice Menard, Robert P. J. Day.
- ▶ To translators:
Guillaume Lelarge (French)
