

## Embedded Linux development with Buildroot training

Course duration \_\_\_\_\_

 3 days – 24 hours

Language \_\_\_\_\_

Materials English

Oral Lecture English  
French

Trainer \_\_\_\_\_

One of the following engineers

- Thomas Petazzoni

Contact \_\_\_\_\_

 training@bootlin.com

 +33 484 258 097

### Audience

Companies already using or interested in using Buildroot to build their embedded Linux systems.

### Training objectives

- Be able to understand the role and principle of an embedded Linux build system, and compare Buildroot to other tools offering similar functionality.
- Be able to create a simple embedded Linux system with Buildroot: create a configuration, run the build, install the result on an embedded platform.
- Be able to adjust the Buildroot configuration to build an embedded Linux system tailored to specific needs: choice of the cross-compilation toolchain, management of the Linux kernel configuration, customization of the root filesystem contents, etc.
- Be able to create new packages in Buildroot to integrate additional applications and libraries into the embedded Linux system.
- Be able to use the tools offered by Buildroot to manage and analyze the build: security vulnerability tracking, license compliance, etc.
- Be able to develop and debug Linux user-space applications in the context of Buildroot.
- Be able to interact with the Buildroot open-source community, and to understand the internals of Buildroot.

### Prerequisites

- **Knowledge and practice of UNIX or GNU/Linux commands:** participants must be familiar with the Linux command line. Participants lacking experience on this topic should get trained by themselves, for example with our [freely available on-line slides](#).
- **Minimal experience in embedded Linux development:** participants should have a minimal understanding of the architecture of embedded Linux systems: role of the Linux kernel vs. user-space, development of Linux user-space applications in C. Following [Bootlin's Embedded Linux course](#) allows to fulfill this pre-requisite.
- **Minimal English language level: B1**, according to the *Common European Framework of References for Languages*, for our sessions in English. See the [CEFR grid](#) for self-evaluation.

### Pedagogics

- Lectures delivered by the trainer: 40% of the duration
- Practical labs done by participants: 60% of the duration
- Electronic copies of presentations, lab instructions and data files. They are freely available [here](#).

### Certificate

Only the participants who have attended all training sessions, and who have scored over 50% of correct answers at the final evaluation will receive a training certificate from Bootlin.

### Disabilities

Participants with disabilities who have special needs are invited to contact us at [training@bootlin.com](mailto:training@bootlin.com) to discuss adaptations to the training course.

Onsite  
training

## Required equipment

For on-site session delivered at our customer location, our customer must provide:

- Video projector
- One PC computer on each desk (for one or two persons) with at least 16 GB of RAM, and Ubuntu Linux 24.04 installed in a free partition of at least 30 GB
- Distributions other than Ubuntu Linux 24.04 are not supported, and using Linux in a virtual machine is not supported.
- Unfiltered and fast connection to Internet: at least 50 Mbit/s of download bandwidth, and no filtering of web sites or protocols.
- PC computers with valuable data must be backed up before being used in our sessions.

For on-site sessions organized at Bootlin premises, Bootlin provides all the necessary equipment.

## Hardware platform for practical labs

### STM32MP1 Discovery Kit

One of these Discovery Kits from STMicroelectronics:

**STM32MP157A-DK1, STM32MP157D-DK1, STM32MP157C-DK2 or STM32MP157F-DK2**

- STM32MP157, dual Cortex-A7 processor from STMicroelectronics
- USB powered
- 512 MB DDR3L RAM
- Gigabit Ethernet port
- 4 USB 2.0 host ports
- 1 USB-C OTG port
- 1 Micro SD slot
- On-board ST-LINK/V2-1 debugger
- Arduino compatible headers
- Audio codec, buttons, LEDs
- LCD touchscreen (DK2 kits only)

### BeagleBone Black

**BeagleBone Black or BeagleBone Black Wireless board**

- An ARM AM335x (single Cortex-A8) processor from Texas Instruments
- USB powered
- 512 MB of RAM
- 2 or 4 GB of on-board eMMC storage
- USB host and device
- HDMI output
- 2 x 46 pins headers, to access UARTs, SPI buses, I2C buses and more.
- Ethernet or WiFi

### Day 1 - Morning

---

Lecture	Embedded Linux and build system introduction	<ul style="list-style-type: none"><li>▪ The general architecture of an embedded Linux system</li><li>▪ Build systems vs. binary distributions</li><li>▪ Role of a build system</li><li>▪ Comparison of existing build systems</li></ul>
Lecture	Introduction to Buildroot	<ul style="list-style-type: none"><li>▪ Key facts about the project</li><li>▪ Getting Buildroot</li><li>▪ Basic configuration of Buildroot</li><li>▪ Doing a first build</li></ul>
Lab	Basic Buildroot usage	<ul style="list-style-type: none"><li>▪ Getting and setting up Buildroot</li><li>▪ Configuring and building a basic system with Buildroot for an embedded platform</li><li>▪ Flash and test the generated system on the embedded platform</li></ul>
Lecture	Managing the build and configuration	<ul style="list-style-type: none"><li>▪ Out of tree build</li><li>▪ Using and creating <i>defconfigs</i></li><li>▪ Defconfig fragments</li><li>▪ Other building tips</li></ul>

---

### Day 1 - Afternoon

---

Lecture	Buildroot source and build trees	<ul style="list-style-type: none"><li>▪ Details about the Buildroot source code organization</li><li>▪ Details about the Buildroot build tree</li></ul>
Lecture	Toolchains in Buildroot	<ul style="list-style-type: none"><li>▪ The different choices for using toolchains in Buildroot</li><li>▪ Overview of the toolchain options</li><li>▪ Using existing binary toolchains, such as Bootlin toolchains, understanding <i>multilib</i> capabilities and integration of toolchains in Buildroot</li><li>▪ Generating custom toolchains with <i>Crosstool-NG</i>, and re-use them as external toolchains</li></ul>
Lecture	Managing the Linux kernel configuration	<ul style="list-style-type: none"><li>▪ Loading, changing and saving the kernel configuration</li></ul>
Lecture	Root filesystem construction in Buildroot	<ul style="list-style-type: none"><li>▪ Understand how Buildroot builds the root filesystem: <i>skeleton</i>, installation of packages, overlays, <i>post-build</i> and <i>post-image</i> scripts.</li><li>▪ Customization of the root filesystem contents</li><li>▪ System configuration: <i>console</i> selection, various <i>/dev</i> management methods, the different <i>init</i> implementations, etc.</li><li>▪ Understand how Buildroot generates filesystem images</li></ul>
Lab	Root filesystem customization	<ul style="list-style-type: none"><li>▪ Explore the build output</li><li>▪ Customize the root filesystem using a <i>rootfs overlay</i></li><li>▪ Customize the kernel with patches and additional configuration options</li><li>▪ Add more packages</li><li>▪ Use <i>defconfig</i> files and <i>out of tree</i> build</li></ul>

---

### Day 2 - Morning

Lecture	Download infrastructure in Buildroot	<ul style="list-style-type: none"> <li>▪ Downloading logic</li> <li>▪ Primary site and backup site, doing offline builds</li> <li>▪ VCS download, integrity checking</li> <li>▪ Download-related <i>make</i> targets</li> </ul>
Lecture	GNU Make 101	<ul style="list-style-type: none"> <li>▪ Basics of make rules</li> <li>▪ Defining and referencing variables</li> <li>▪ Conditions, functions</li> <li>▪ Writing recipes</li> </ul>
Lecture	Integrating new packages in Buildroot	<ul style="list-style-type: none"> <li>▪ How to integrate new packages in the Buildroot configuration system</li> <li>▪ Understand the different package infrastructures: for <i>generic</i>, <i>auto-tools</i>, <i>CMake</i>, <i>Python</i> packages and more.</li> <li>▪ Writing a package <code>Config.in</code> file: how to express dependencies on other packages, on toolchain options, etc.</li> <li>▪ Details on writing a package recipe: describing the package source code location, download method, configuration, build and installation steps, handling dependencies, etc.</li> </ul>
Lab	New packages in Buildroot	<ul style="list-style-type: none"> <li>▪ Create a new package for <i>nInvaders</i></li> <li>▪ Understand how to add dependencies</li> <li>▪ Add patches to <i>nInvaders</i> for <i>Nunchuk</i> support</li> </ul>

## Day 2 - Afternoon

Lecture	Advanced package aspects	<ul style="list-style-type: none"> <li>▪ Licensing report</li> <li>▪ Patching support: patch ordering and format, global patch directory, etc.</li> <li>▪ User, permission, device tables</li> <li>▪ Init scripts and systemd unit files</li> <li>▪ Config scripts</li> <li>▪ Understanding <i>hooks</i></li> <li>▪ Overriding commands</li> <li>▪ Legacy handling</li> <li>▪ Virtual packages</li> </ul>
Lab	Advanced packages	<ul style="list-style-type: none"> <li>▪ Package an application with a mandatory dependency and an optional dependency</li> <li>▪ Package a library, hosted on GitHub</li> <li>▪ Use <i>hooks</i> to tweak packages</li> <li>▪ Add a patch to a package</li> </ul>

## Day 3 - Morning

Lecture	Analyzing the build: licensing, dependencies, build time	<ul style="list-style-type: none"> <li>▪ Usage of the legal information infrastructure</li> <li>▪ Graphing dependencies of packages</li> <li>▪ Collecting and graphing build time information</li> </ul>
Lecture	Advanced topics	<ul style="list-style-type: none"> <li>▪ <code>BR2_EXTERNAL</code> to store customizations outside of the Buildroot sources</li> <li>▪ Package-specific targets</li> <li>▪ Understanding rebuilds</li> <li>▪ Tips for building faster</li> </ul>
Lab	Advanced aspects	<ul style="list-style-type: none"> <li>▪ Use build time graphing capabilities</li> <li>▪ Use dependency graphing capabilities</li> <li>▪ Use licensing report generation, and add licensing information to your own packages</li> <li>▪ Use <code>BR2_EXTERNAL</code></li> </ul>

---

## Day 3 - Afternoon

---

Lecture	Application development with Buildroot	<ul style="list-style-type: none"><li>▪ Using Buildroot during application development</li><li>▪ Usage of the Buildroot environment to build applications outside of Buildroot</li><li>▪ Generate an SDK for other developers</li><li>▪ Remote debugging with Buildroot</li></ul>
Lab	Application development with Buildroot	<ul style="list-style-type: none"><li>▪ Build and run your own application</li><li>▪ Remote debug your application</li><li>▪ Use <code>&lt;pkg&gt;_OVERRIDE_SRCDIR</code></li></ul>
Lecture	Understanding Buildroot internals	<ul style="list-style-type: none"><li>▪ Detailed description of the Buildroot build process: toolchain, packages, root filesystem construction, stamp files, etc.</li><li>▪ Understanding virtual packages.</li></ul>
Lecture	Getting support and contributing	<ul style="list-style-type: none"><li>▪ Getting support: <i>Bugzilla, mailing list, IRC</i></li><li>▪ Contributing: understanding the development process, how to submit patches</li></ul>
