I think that this course is pretty good despite the topic is very tough.

Excellent. The material to be covered was huge.

Good overview of the Yocto Project and OpenEmbedded, covering the main aspects necessary to get started on a project.

It has been a great course! The overall speed when presenting new topics was a little bit too high and I've got the opportunity to really understand some of the topics only the day afterwards while performing by myself the labs

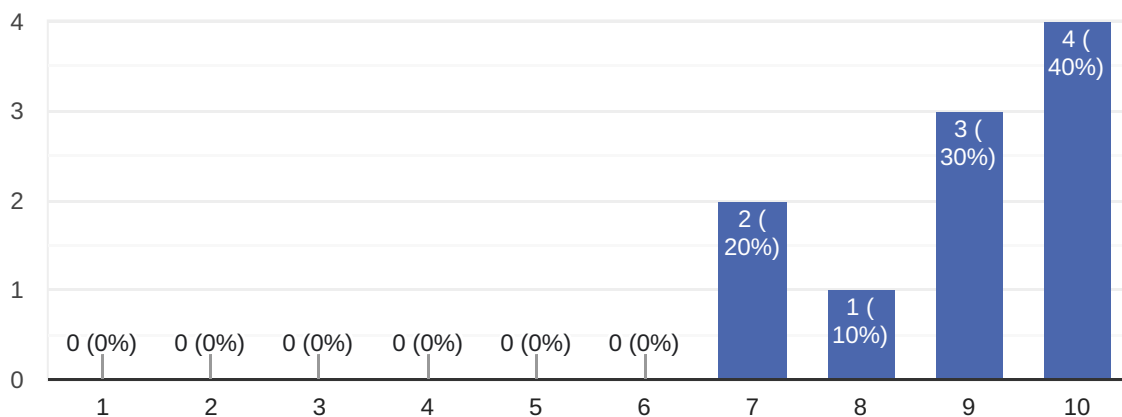

The notions seen are well targetted and are what we expect to get to improve in yocto. It is the pace which is the problem.

### How useful were the lectures?

It would be nice to have a reference document on top of the slides describing more in detail the topics.

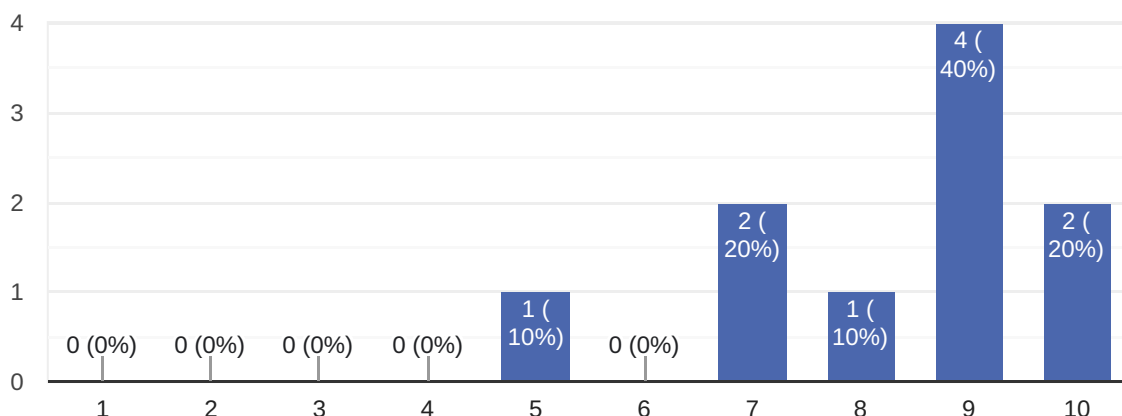

Very thankful to Alexandre Belloni for taking extreme efforts in explaining Yocto in a simple and understandable manner. Now I have a good base on Yocto which I can build on.

The lecture are useful to improve.

### How useful were the practical demos?

I had no prior knowledge in Yocto before attending the course. Hence the demos on the 4th and 5th day were very fast. I could understand what was going on in the demo the first three days.

Very helpful to get the confidence you can do all this by yourself

I would like to have a day between each lesson to be able to review the practical demos

Labs are not reproducible without already knowing how to do the lab

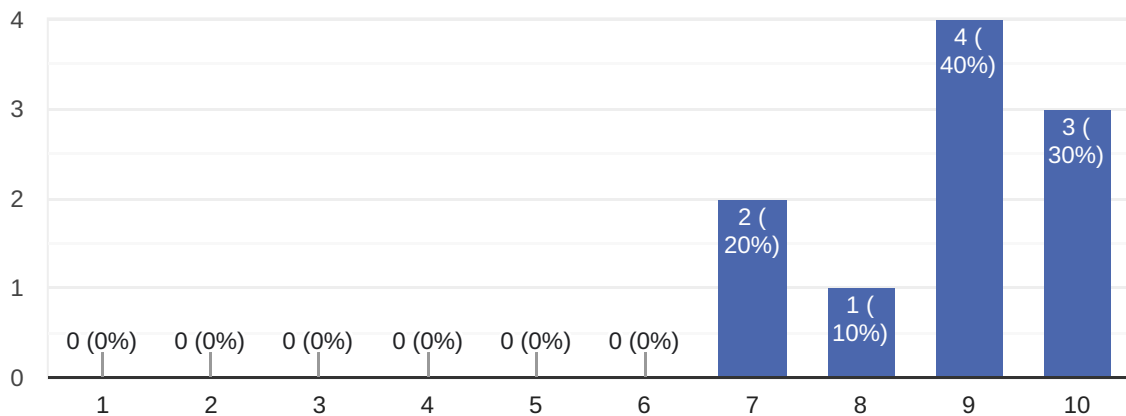

Sometimes a bit fast, was easy to miss a command because the presenter changed windows

The demos are very important, but they are not shown in a human readable way. The pace is far too fast to be able to grasp the minimum. Remember that a coma is important. At distance, the only thing we have is a screen. When you time a command line, imagine that the full command is seeable when you press Enter, and then the command disappears behind another screen.

### How would you rate the overall organization of the course?

I would definitely change the meeting system, I experienced many connection losses.

### How would you rate the trainer?

Great and broad experience using the Yocto Project, contributing to it and following its latest developments. Thanks Alex!

Alexandre is a great trainer

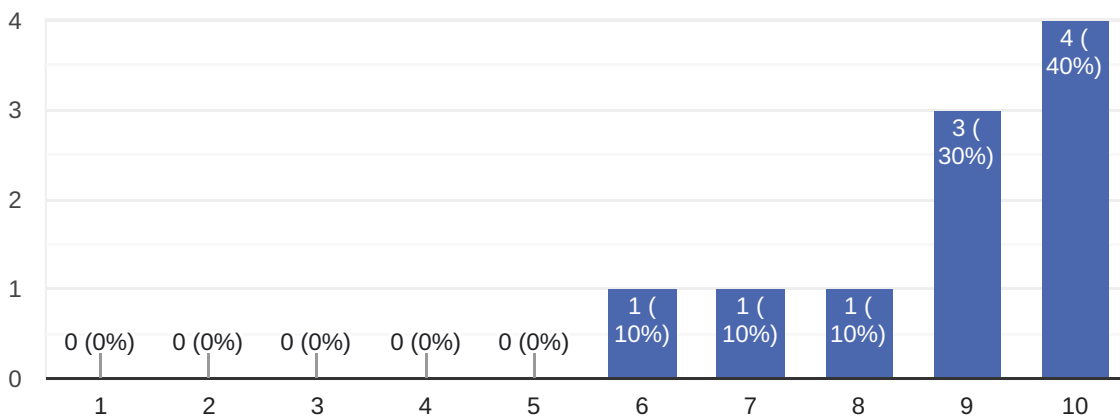

I would like to know the presenter's vim config :)

The trainer has full knowledge, that is obvious, but the harder it gets, the faster he speaks... maybe twice faster than usual speech, and with a french accent, which makes it harder sometimes. A real reflexion should be made on the pace of the speech and the demos to be able to give the full meaning of the course.

### How did the course meet your learning objectives?

Got exactly what I wanted, a boost for beginning to use Yocto the right way

The things shown are very well pointed, but the speed makes it unable to grasp. A slow down for the demo would do the difference.

### What part(s) of the course did you like most?

6 responses

Patching nInvaders

The devtool part, because it will help me maintain some recipes

Practical labs and examples

I enjoyed everytime the instructor spawned a shell to showcase anything. I think it's a good approach to approach the course material from a practical perspective.

demos

The explanation of how bitbake does the job. Also the tools we can use to check if the build is going well.

### What part(s) of the course did you like least?

4 responses

The last 2 days of the course were pretty fast. However, I think the topics covered were huge and all of them could not be covered in 5 days. This was the reason that the sessions went fast the last 2 days..

None. Everything looked useful

Advance part

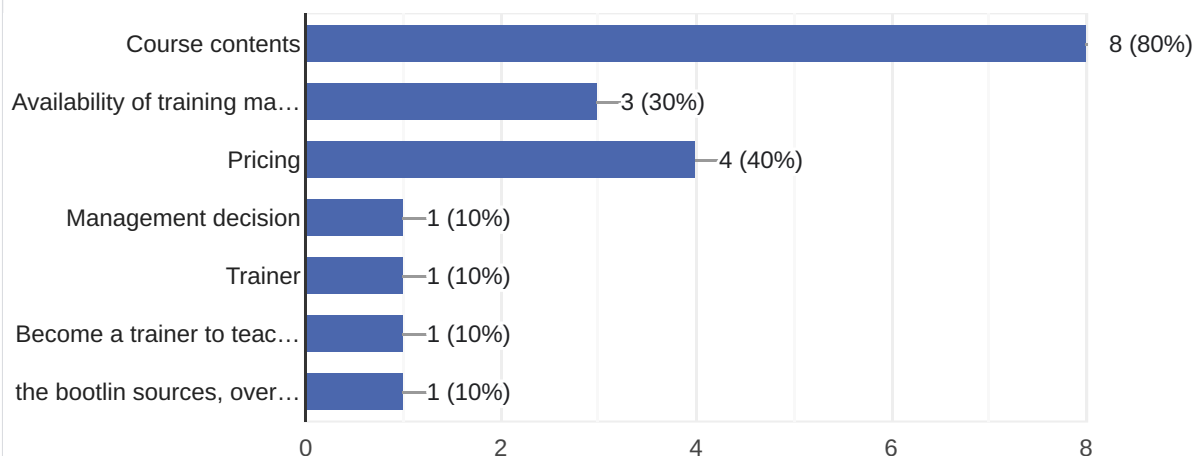

Hard to say.

### What reasons prompted you to choose a Bootlin course?

A suggestion to improve. Maybe the less used features of Yocto can be omitted in the course to give more time for the important ones.

After the course, maybe a "history" of the commands the presenter used in case we had any issues following along, since an issue somewhere can have a cascading effect in following along for the next steps even after-hours

In my opinion, less can be said to slow down the pace and keep value to the course. Tricks to debug are very interesting. The labs to do and the density of the courses make it difficult to follow deeply. It would interesting to separate one day session from the other, say spread the 4 days in 2 weeks instead.

### Further training needs?
